

## ZipDeploy Prepare, Upload and Deploy Page

{TS-001}{TUTORIAL-STEPS}

Now you're done. ZipDeploy will continue by itself by performing the following tasks:

- Prepare (quasi-instantaneous)
- Upload (will take some time, especially if your Zip is some Mbytes big)
- Deploy (from 10 to 100 seconds maximum)

(This screenshot comes from Linux - we wanted to give each OS a chance ).

The Upload will take some time depending on your connection and Zip filesize. However, ususally 2 to 10 times less than a regular FTP transfer! A progressbar will show you the status of this process.

Deployment will follow, (the respective bulbs will blink during operation) and when ready, you will be informed about the process activity.

When ready, ZipDeploy will generate a detailed report on site, in a file called zdreport.txt . The URL to this file will show up, so youc an consult this file in your favourite browser (if curious). THAT'S IT !

You have completed your first deployment with ZipDeploy!
