

## Outstanding upload speed (2 to 10 times faster than regular FTP transfers)

What's your "favourite" scenario for a -say- osCommerce install?

- Download the latest package (2 minutes)
- Unpack it to your hard drive (30 seconds)
- Start uploading using FTP
- Take a coffee...
- Check if your upload is finished... Well, it isn't!
- Wait some more time...
- Read the newspapers (online)...
- Check if your upload is finished... You were disconnected!
- Breathe deeply until you get yourself together.
- Reconnect to your website, try to figure out which files were uploaded and which not... and you cannot... should you restart the transfer?

If this story seems familiar, you're at the right place.

ZipDeploy is 100% to 1000% faster than regular FTP transfers

... so it doesn't have time to get disconnected! Watch the VIDEO! How so?

- ZipDeploy doesn't upload 1000 files. It uploads just one. Your Zip package.
- ZipDeploy uploads less kilobytes. Just compare the size of your Zip package with the total size of the unzipped directory. There's a big difference, isn't it?
- ZipDeploy uncompresses (unzips) on the remote host, or the remote server, where your website is located. Want to try it yourself? Download and run ZipDeploy right now!
